1. Project Description

This web app allows users to input their scores (e.g., quizzes, exams) and automatically calculates the **average grade** and displays a remark (Pass/Fail).

---

2. AI Prompts Used

Prompt 1:

Create a simple HTML page with two number inputs and a button that calculates the average using JavaScript.

Prompt 2:

Improve the design using CSS to make it look modern and centered.

Prompt 3:

Add validation so the user cannot input empty values and show an alert if they do.

Prompt 4:

Add a feature that shows “Pass” if average is 75 or above, otherwise “Fail”.

3. Final Code (HTML + CSS + JavaScript)

```
<!DOCTYPE html>
<html>
<head>
  <title>Grade Calculator</title>
  <style>
    body {
      font-family: Arial;
      background: #f4f4f4;
      text-align: center;
      margin-top: 50px;
    }
    .container {
      background: white;
```

```
            padding: 20px;
            width: 300px;
            margin: auto;
            border-radius: 10px;
            box-shadow: 0 0 10px gray;
        }
        input {
            margin: 10px;
            padding: 8px;
            width: 80%;
        }
        button {
            padding: 10px;
            background: #007BFF;
            color: white;
            border: none;
            border-radius: 5px;
        }
        button:hover {
            background: #0056b3;
        }
        #result {
            margin-top: 15px;
            font-weight: bold;
        }
    </style>
</head>
<body>

<div class="container">
    <h2>Grade Calculator</h2>
    <input type="number" id="score1" placeholder="Enter Score 1">
    <input type="number" id="score2" placeholder="Enter Score 2">
    <br>
    <button onclick="calculate()">Calculate</button>
    <p id="result"></p>
</div>

<script>
function calculate() {
    let s1 = document.getElementById("score1").value;
    let s2 = document.getElementById("score2").value;

    if (s1 === "" || s2 === "") {
```

```
        alert("Please enter both scores!");
        return;
    }

    let avg = (parseFloat(s1) + parseFloat(s2)) / 2;
    let remark = avg >= 75 ? "Pass" : "Fail";

    document.getElementById("result").innerHTML =
        "Average: " + avg.toFixed(2) + " - " + remark;
}
</script>

</body>
</html>
```

4. Features Implemented

- Input fields for scores
- Button to calculate average
- Validation (prevents empty input)
- Pass/Fail indicator
- Styled layout (centered card design)

---

5. Reflection

What worked well with AI:

- AI quickly generated the basic structure (HTML + JS)
- Helped improve the design without writing CSS manually

What needed fixing:

- The first version didn’t include validation
- Had to adjust spacing and layout manually

What I learned:

- How JavaScript interacts with HTML inputs
- How to refine prompts to get better results
- AI is helpful, but still needs human checking

6. Live Deployment
